Dafa Frames in R

Mohannad Hisham

Defining Vectors

Firstly we begin by making data vectors.
Vectors can be made simply as this example

```r
names = c("Mohannad","Essam","Abood","Mafs")
school_marks = c(98,99,100,96)
qodorat_marks = c(98,94,96,91)
```

Defining Data Frame

Data Frames are defined like this

```r
students = data.frame(names,school_marks,qodorat_marks);
```

names	school_marks	qodorat_marks
Mohannad	98	98
Essam	99	94
Abood	100	96
Mafs	96	91

Making a new column with computed grades

```r
students$computed_grades = students$school_marks * 0.7 + students$qodorat_marks * 0.3
```

names	school_marks	qodorat_marks	computed_grades
Mohannad	98	98	98.0
Essam	99	94	97.5
Abood	100	96	98.8
Mafs	96	91	94.5
